

G.I. Wanna Talk About Autism

Gastrointestinal (GI) symptoms are health problems that affect your stomach and intestines. They are common and can really affect your life. There is not a lot of research about GI symptoms in autistic adults. We are doing this study to get more understanding of autistic adults' experiences and needs with GI health issues and what's most important to them.

You can participate if you

- ✓ Are 18 years or older
- ✓ Identify as autistic
- ✓ Have GI symptoms or have had them in the past
- ✓ Lives in USA
- ✓ Speak English

SCAN ME

Are You an Autistic Adult (18 years or older) with a history of GI symptoms?

If you answered **YES**, then you might be able to participate in a Research Study to learn about gastrointestinal (GI) symptoms in autistic adults. *You can be in the study yourself or your parent or caregiver can answer questions for you.*

If you are interested in being a part of our study, go to the website www.GIWannaTalkAboutAutism.com to fill out the Pre-Enrollment Screening Survey. If we choose you to be in the study, you will participate in one or two interviews (45 – 90 minutes each). People who do our study will be paid for each interview they do.

This project is supported by the Health Resources and Services Administration (HRSA) of the US Department of Health and Human Services (HHS) under award UT2MC39440, the Autism Intervention Research Network on Physical Health.
