

Research Study Opportunity

Center for Autism and Related Disorders
at Kennedy Krieger Institute

Seeking preschool children with autism spectrum disorder to participate in a research study

You can help researchers learn about anxiety in preschool children with autism spectrum disorder (ASD).

Why is participating in this research study important?

- Anxiety is very common in individuals with ASD
- Untreated anxiety can increase ASD symptoms, interfere with treatments, and increase risk for other mental health problems.
- Research is needed to better understand anxiety and develop treatments for preschoolers with ASD.

Your child may qualify if he/she

- Has a diagnosis or suspected diagnosis of ASD
 - Is between 3 to 5 years old

What is involved?

- Parents will answer questions about their child and about their own well-being.
- Some questions can be completed on site and some will be completed at home.

Dr. Roma Vasa, Principal Investigator
JHMI IRB Protocol # IRB00173329
